Enigmallife wins innovation award

Schottlander

Enigmallife denture teeth have been voted Most Innovative Product of the Year by the members of the British Dental Laboratories Association. The Dental Laboratories Association (DLA) is the professional body for dental laboratory owners in the UK, with more than 1000 members. It is estimated that DLA members provide more than 80% of the dental laboratory services in the UK.

Receiving the prestigious award on behalf of Schottlander, managing director Brian Schottlander commented: 'Considering enigmallife was only launched internationally at IDS in March and in the UK market in April, this is a fantastic endorsement. The response to the aesthetics of enigmallife has been amazing and a true endorsement of the talented team, both inside and outside Schottlander, who worked for five years in developing this range'.

Carolyn Ansell, Schottlander's UK sales manager continued: 'to receive this award, voted on by 70% of the DLA's membership, is a terrific acknowledgement by British laboratory owners of how this range is both helping patients and driving their businesses forward.'

Water flosser proves to be a wise choice

Waterpik

Isabel Burgess, dental nurse at Rocky Lane Dental Practice in Heswall, commented on her Waterpik Water Flosser, she said: 'I have a wisdom tooth with a large food trap that is really difficult to clean effectively, but since starting using the Waterpik Cordless Plus Water Flosser, it hasn't been infected.'

'I normally recommend this model as it is the one I have had much success with. I found the water flosser to be better than interdental brushes for my infected wisdom tooth, and more effective than brushing alone or also using interdental brushes with my fixed orthodontic appliance.'

Clinically proven to reduce bleeding and reverse gingivitis, the Waterpik Water Flosser is the ideal adjunctive tool to help all patients enhance their oral health, regardless of current treatment.

Expanding to endo with Dr Flynn

London Smile Clinic

The team has expanded its remit into the endodontics arena alongside Dr Daniel Flynn – a gold standard 'specialist' with an impressive pedigree.

Currently splitting his time between the London Smile Clinic and lecturing at the largest postgraduate dental school in Europe, Dr Flynn is well placed to tackle the most challenging dental treatments in his chosen field.

The London Smile Clinic offers the latest technology ensuring the gentlest, pain-free dental treatments within the profession, constituting impeccable service.

As a professional with an ingrained sense of pride in one's work, referring patients for specialist care can be a daunting task.

Dental professionals require as much professionalism and consideration towards those who have entrusted them with their health as they themselves have offered.

The London Smile Clinic will deliver on all counts.

More than just a referral clinic

Endocare

Endocare strives to be more than just the clinic dentists send patients to for the treatments they cannot provide – it aims to be an integral part of their team.

It ensures referring dentists are kept up-to-date with every facet of the patient's time with Endocare, so they can be assured of the quality of treatment they are receiving. It aims to always keep their dentist involved.

Endocare creates a homogenous service to save dentists time and ensures dentists their patients are receiving the best care.

With three state-of-the-art facilities and an experienced team, Endocare can be a solution to the profession's referral needs.

Getting to the root of dental pain

Keeping natural teeth for longer

Periochip

PerioChip®

Periodontal disease is a common chronic infection and a major cause of tooth loss. But with the help of Periochip, dental professionals can stop it in its tracks. After root surface debridement (RSD), Periochip can kill off putative periodontal pathogens and prevent them from re-establishing on root surfaces and in periodontal pockets.

Periochip is a non-antibiotic insert, containing chlorhexidine digluconate that is easy to place and biodegradable. It is designed for periodontal pockets more than 5mm deep and provides an effective adjunctive therapy.

After placement, Periochip uses a controlled-release system to target the site with the active ingredient and eliminate 99% of perio-pathogenic bacteria over the first seven days. Then, Periochip carries on suppressing the growth of bacterial flora in the treated area for up to 11 weeks, providing time for the teeth to stabilise.

Placed directly into periodontal pockets more than 5mm, clinical studies showed a pocket reduction of more than 2mm in almost three quarters of patients when Periochip was placed every three months, in combination with RSD. Help patients to keep their natural teeth for longer by calling the Periochip team now.
